Global Warming: Death of Human Race

STOP GLOBAL WARMING

Global warming is one of the biggest problems the world is currently facing. Temperatures continue to rise year after year, causing the polar ice caps to melt and sea levels to rise which could cause major flooding of our towns and cities.

Humans are one of the biggest causes of global warming. Here are a few things we can do to help prevent climate change:

- Walk or cycle to school instead of travelling by car cars omit gases which are harmful to the environment.
- Reduce, reuse and recycle. Try to cut down on the materials that you buy and reuse or recycle the ones that you do buy if possible.
- Switch off your TVs and computers if you are not using them, as well as all light switches if they do not need to be on.

Human activity is at least partially to blame for Earth's warming. Identifying the causes, consequences, and complexities of global warming is crucial if we are to take action to protect the world. Climate change is a new problem brought on by global warming. Although these terms are occasionally used synonymously, they have different meanings. The term "climate change" describes modifications to global growth seasons and weather patterns. It also describes the rise in sea level brought on by the melting of glaciers and ice sheets and the expansion of warmer oceans. Climate change, a result of global warming, threatens life as we know it by bringing catastrophic weather patterns and extensive flooding. Researchers are still looking into the effects of global warming on Earth
